1Num Platform Public Roll-out

April 5, 2005 - One Number Corporation today announced a new "1Num" service for business and Family customers aimed at the growing number of companies and professionals that are demanding such innovations to improve their business results, productivity and communication efficiency.

In one single instance, our product will ring every "Reach Me" number assigned to your account. You choose the phone to receive the call and your caller enjoys the convenience of remembering only one number. Many families juggle five or more numbers. With the 1Num Family package, multiple numbers are reduced to just one, giving parents the peace of mind that they can be reached easily with one number.

One Number said it understands that customers require connectivity to numerous phone numbers. Our 1Num platform is an example of how One Number Corporation is meeting those needs. This new service complements any phone or phone system. This new service features:

- Dynamic real-time call control via the total control voice and web portal.
- A nationwide calling area with local numbers in 50 markets and more to come quickly.
- True, unified messaging into an email account of your choosing. Receive fax, voice messages and email in one location.

"Customer demand and technology advancements have guided our actions in developing our 1Num platform," said Brandon McLarty, president. "Consistent with our strategy, we're now using our expertise to deliver this service on our powerful network. We're taking advantage of our advanced network capabilities and creating new, valuable applications -- such as on demand call control -- for businesses any way and any time they want them.

"Businesses are the barometer for how new technologies will be adopted by the marketplace," he added. "We're delivering this 1Num solution today because businesses are demanding them. At the same time, we're realizing the market potential of Family consumers through our 1Num Alert product."

"The convergence of old and new technologies doesn't happen by flipping a switch," said McLarty. "New networking technology and architectures must give customers the ability to take advantage of new applications without stranding their existing investments in their own phone systems or cellular plans.

"We're now leveraging our size, ability to scale and our network integration expertise to deliver to customers the next generation of SIP and VOIP services and applications," said McLarty.
